

# PALLADIUM

## Owned Intelligence for the legal profession.

*Legal AI that never leaves your control.*

### It runs inside your firm.

On your premises or in your firm's own cloud, on a model your firm owns. Most vendors offer zero data retention (ZDR): they delete what you send, and whatever their system learned from it goes too. Palladium is built on zero intelligence retention (ZIR): nothing is kept outside the firm.

### Secure by default. Frontier on demand.

Every matter starts on a secure internal model. When a question needs more, lawyers bring in Claude, GPT, Gemini or Grok from the same menu.

### Only placeholders cross the perimeter.

Names, parties and figures become placeholders, and anything that could be inferred from what is left is removed, before anything goes to an outside model. They are restored inside the firm when the answer comes back.

### Every edit, on the record.

Assistant edits arrive as tracked changes for a lawyer to accept or reject. Each decision is written to the matter's audit trail, which stays with the firm.

### Every matter makes your firm smarter.

Every reasoning trace your lawyers build stays with the firm and sharpens your firm's own model, so each matter starts from everything the last one taught it.

### Who it's for

Firms that want to own their intelligence. Every prompt into a rented tool teaches the vendor's model how your lawyers do their job. Palladium is for firms that want AI to make their lawyers better, and want what it learns to stay theirs.

### What you need to run it

A private GPU instance in your environment, a connection to your document system, and single sign-on. We handle deployment and configure redaction against sample documents before any real matter is loaded.

## Why rent AI when you can own intelligence?

Law firms have always traded on what they know. Most legal AI is rented: the vendor owns the models and everything built on them. Palladium puts the best AI available to work on your firm's knowledge, owned by and under your firm's control.

### What lawyers do with it

- **Draft and review** contracts, memos and filings on the internal model, with every change tracked.
- **Ask about any document** in a matter, with answers grounded in the firm's files.
- **Redact a whole matter** in one pass. Uncertain matches wait for a lawyer; each decision applies across every document.
- **Take a question to the frontier** with client details already removed.

### The Adversarial Frontier Council

**One question. Four frontier models. One answer your firm can stand behind.**

When a question needs more, Palladium puts it to Anthropic, OpenAI, Google and xAI at the same time, with client details already removed. A Palladium agent inside your perimeter weighs the four responses against each other and returns one consensus answer with a Defensibility Score, rebuilt with the client context inside the firm. Your lawyers get frontier reasoning; your clients' information never leaves the walls.

### What your firm keeps

The platform, the model, the redaction map for every matter, the audit trail, and every reasoning trace your lawyers build. None of it is visible to us or trains a model outside the firm. If you stop working with us, it stays with you and keeps running.

**Rented AI:** the firm keeps nothing

**PALLADIUM:** the firm keeps everything
